李金洲 作者: 日期: 2017/8/11

概要: 书写一个1+2=3的脚本

目标:整体把握【知识体系】和【开发流程】及【工具使用】

详细:

• 了解 android 自动化测试框架

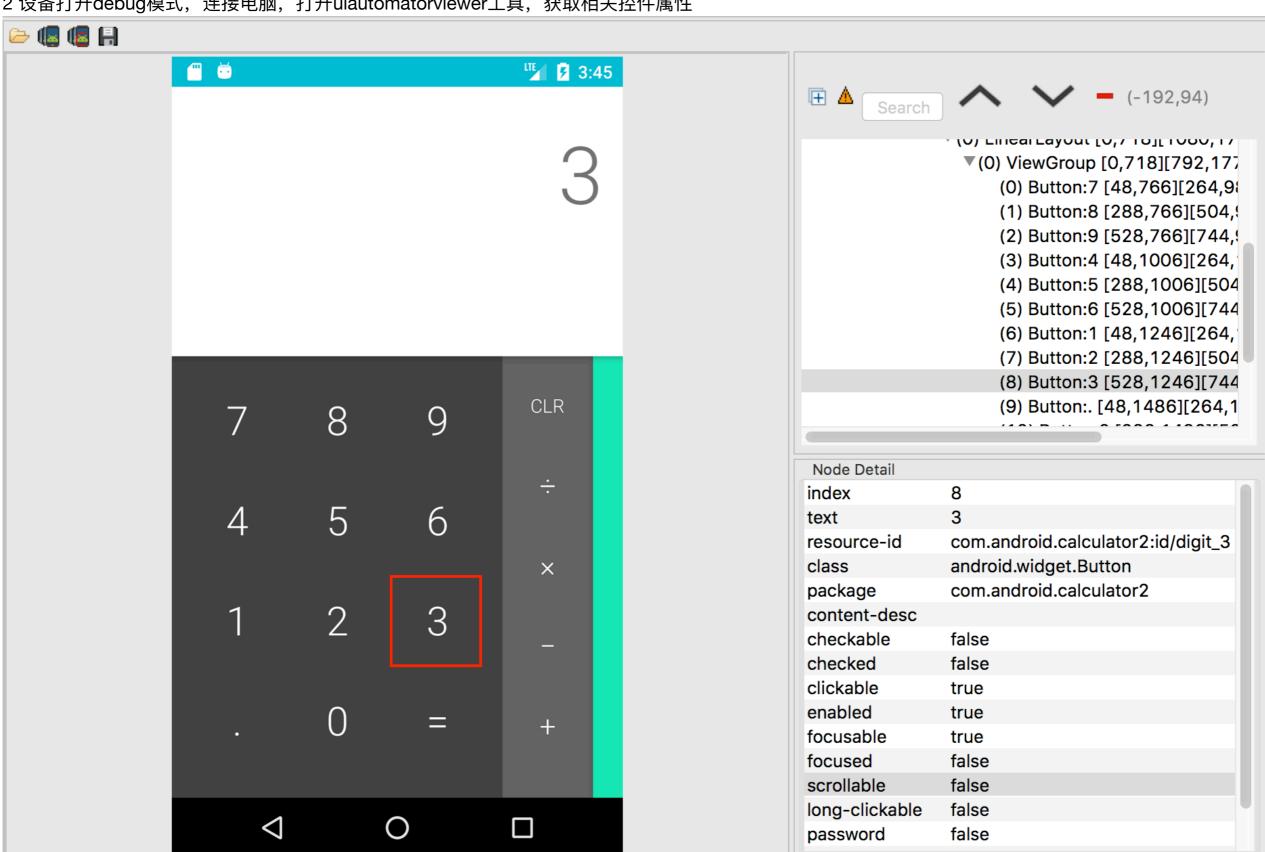

• 写一个Demo

1 测试用例

setp1: 启动计算器 step2: 计算1+2 step3:验证等于3 step4: 关闭计算器

2 设备打开debug模式,连接电脑,打开uiautomatorviewer工具,获取相关控件属性

3 参考代码

```
#!/usr/bin/env python
  coding: utf-8
以 Pixel虚拟机 为例
计算 1 + 2 = 3
from uiautomator import Device
driver = Device()
 不同设备,这两个变量值有所不同
calculator_package = "com.android.calculator2"
calculator_activity = ".Calculator"
# 启动计算器
#driver.shell_adb("shell am start -n 'com.android.calculator2/.Calculator'")
driver.start_activity(calculator_package, calculator_activity)
driver.delay(3)
driver(resourceId="com.android.calculator2:id/digit_1").click() # click 1
driver.delay(1)
driver(resourceId="com.android.calculator2:id/op_add").click() # click +
driver.delay(1)
driver(resourceId="com.android.calculator2:id/digit_2").click() # click 2
driver.delay(1)
driver(resourceId="com.android.calculator2:id/eq").click() # click =
driver.delay(3)
if driver(resourceId="com.android.calculator2:id/formula").get_text() == "3":
print "success"
else:
print "faile"
driver.press.home()
```
